

Scenario

You are a trainee web designer at “The Agency”. For your first job you have been asked to produce a website based on a [design mockup](#) given to you by the graphic designer.

The website is for client “Nature Snap Photography”, a photography studio. You will create a simple website consisting of an index.html file, a linked site.css file (containing all the website styles) and an images.zip file provided to you.

Your supervisor, Rachael, the lead web designer, has made it very clear that it is company policy to create the website styles using external Cascading Style Sheets (CSS) i.e. you are NOT to add styles to the html file or format your grid styles using a table, you must use appropriate DIV classes and CSS to position your elements.

Rachael has emailed you specific instructions of how she would like the website created. You need to do the following:

- Review the [design mock-up](#) provided.
- Determine the design requirements including:
 - Formatting and positioning of images, text and menus
 - Formatting of border styles and colours for images
 - List positioning on the page
 - Formatting and positioning of a box in the header that displays special event information.
- Create a CSS roughs document using the [template provided](#) completing the CSS code you will use to achieve your design formatting.
- Create your website with:
 - an index.html file and one (1) other webpage html file,
 - a linked CSS file named site.css and
 - [images folder](#) provided.
- Test and validate your website.
